

WORK EXPERIENCE

Jan 2026 — Present	Full Stack Developer, NutriGo Project WFH - Developed the frontend using Next.js and built backend services with NestJS, creating a modern full-stack web application. - Designed and implemented RESTful APIs and wrote maintainable, scalable code to support long-term system growth. - Implemented Unit Tests and Integration Tests to ensure system reliability and maintain high code quality. - Designed and managed the PostgreSQL database, including schema design and data management for application features. - Used Docker to manage the project environment and ensure consistent development and deployment processes. - Integrated the Omise Payment Gateway to support secure online payments within the platform. - Implemented WebSocket-based real-time chat functionality to enable live communication between users. - Gained hands-on experience working with payment systems, real-time communication technologies, and production-level application architecture.
Apr 2024 — May 2025	Full Stack Developer, StockUp WFH - Developed scalable web applications using Next.js for frontend development and Golang (Gin + GORM) to build reliable backend services. - Implemented RESTful APIs with Go to enable smooth data communication between the client interface and server-side logic. - Designed and maintained PostgreSQL databases, including creating schemas and writing efficient SQL queries for data management. - Utilized Docker to containerize applications and support consistent environments during development and deployment. - Performed code reviews, testing, and debugging to improve software quality before production release.
Sep 2024 — Nov 2024	Mystic Dawn, Java OOP Project WFH - Developed an adventure-style game using Java (without frameworks) to demonstrate core Object-Oriented Programming (OOP) principles. - Designed and implemented game mechanics including monster battles, item drops, and character progression systems. - Applied key OOP concepts such as encapsulation, inheritance, polymorphism, and abstraction to structure the game architecture. - Designed game maps, characters, and gameplay logic, focusing on problem-solving and logical system design. - Implemented core game logic involving algorithms, calculations, and state management for combat and item systems. - Strengthened understanding of software design, object-oriented architecture, and logical problem-solving through building the game from scratch.

EDUCATION

Jul 2023 - Jul 2027	B.Eng. in Computer Engineering, Kasetsart University Nakornpathom,Thailand
---------------------	--

SKILLS

Next.Js(React TypeScript),Nest.Js(Node.js)	Go,Gin,Gorm
Postgres	Jest
Version Control (Git)	Docker
Java(Spring Boot)
